

The 10-Minute Small Business Security Self-Check

FIX. SECURE. AUTOMATE.

Ten honest yes/no questions. No fear tactics, no jargon — just the things that actually matter, the same way we'd walk through it with you on the phone. Go through these for real; most take ten seconds to answer.

- | | |
|----|---|
| 1 | Multi-factor authentication (MFA) is turned on for email and banking — not just a password. |
| 2 | Nobody on the team reuses the same password across multiple accounts. |
| 3 | Computers and phones lock automatically after a few minutes of inactivity. |
| 4 | You can name, right now, who still has access to old shared accounts — and whether they should. |
| 5 | Your backups have actually been tested, not just set up once and forgotten. |
| 6 | Software and operating system updates aren't sitting there ignored. |
| 7 | Your Wi-Fi password isn't the one a contractor or guest got two years ago. |
| 8 | No shared cloud folder is set to "anyone with the link can edit." |
| 9 | Your website's SSL certificate is valid (the padlock shows, no browser warnings). |
| 10 | You know exactly who to call if something goes wrong — before it happens, not during. |

If more than two of these gave you pause

That's exactly what the Cybersecurity & Device Health Check is for — a real review of your devices, accounts, and network, explained in plain English, with a clear next step instead of a panic-inducing report. Starts at \$299.

Questions about any of these? Call or text (609) 200-1879, or email Jay-I@icefixit.com — a real person reads and answers both.
